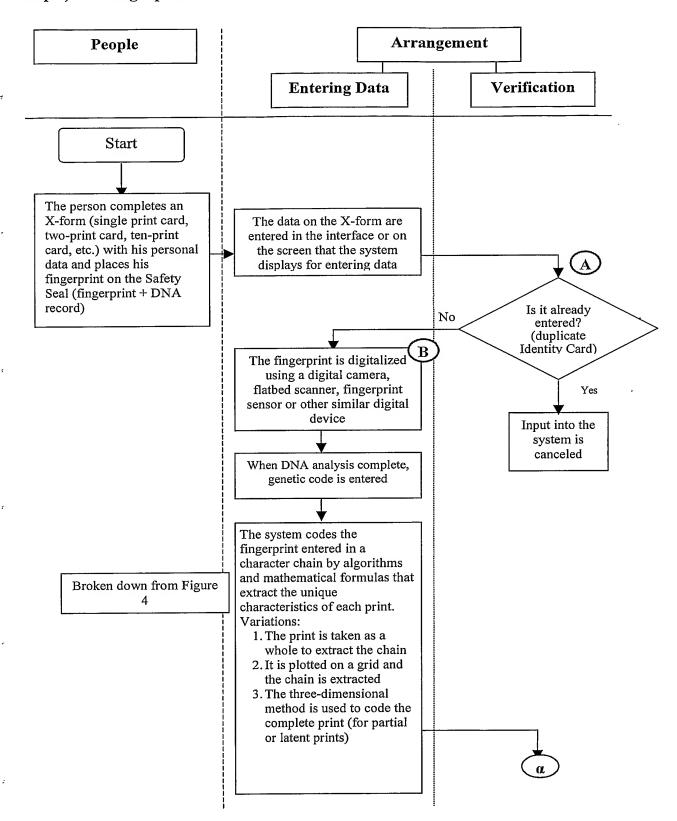

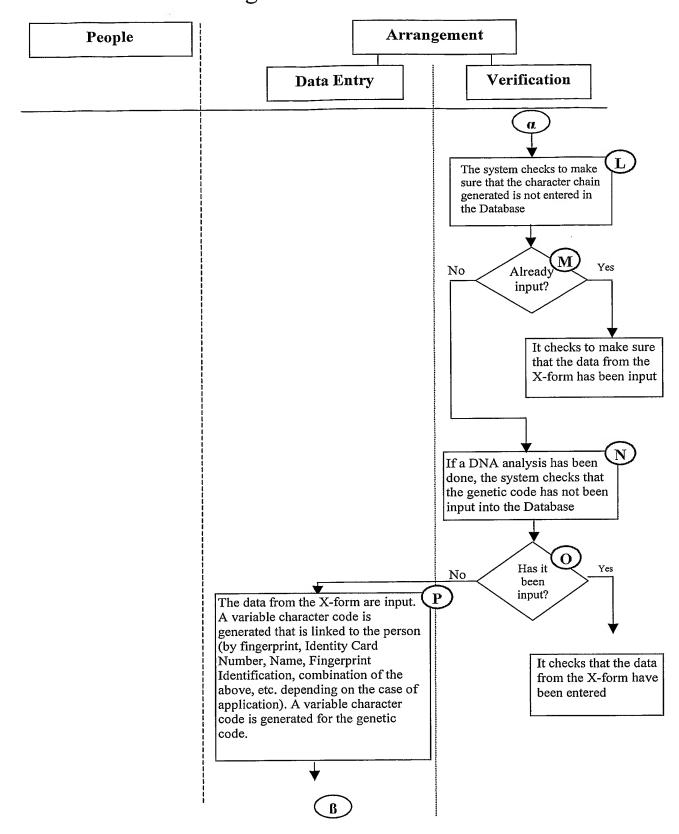

Figure 1A

Step 1) Entering a person's data in the database

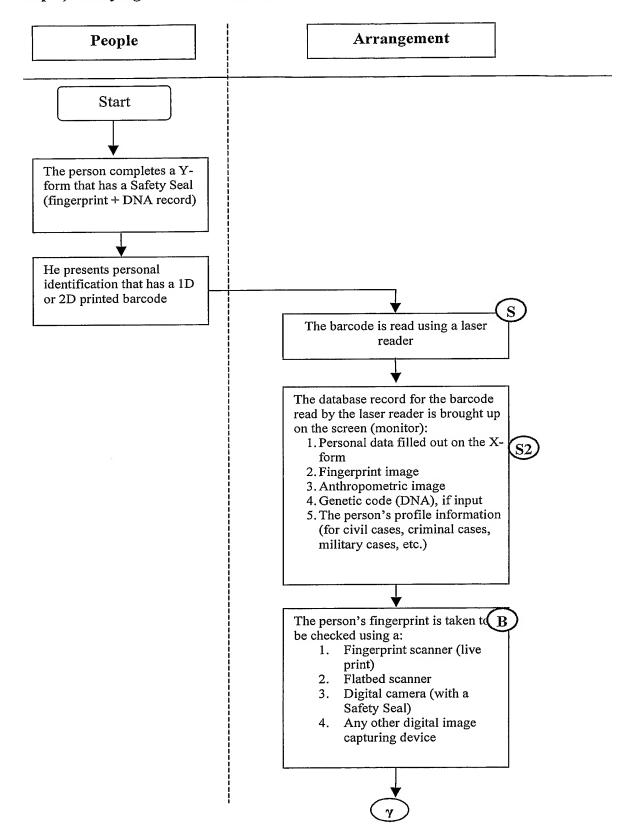

Arrangement People **Data Entry** Verification ß J The variable character code associated to the person is represented in a 1D or 2D barcode, depending on the length of the code, according to barcode capacity O If the genetic code has already been entered, the variable character code is represented in a 1D or 2D code depending on the length of the code, according to barcode length (K The 1D or 2D barcode associated with the person is printed using a laser or thermal printer on: 1. A tag with or without an RFID chip, depending on the case of application, to be affixed to any kind of document. 2. X-Form 3. Identity Document 4. Immigration Card 5. Identity Card 6. Any other means of personal identification that shows the printed barcode \mathbf{R} If a genetic code has been generated, the 1D or 2D barcode is printed using a laser or thermal printer in the medium appropriate for the case

End

Step 2) Verifying a Person's Identity

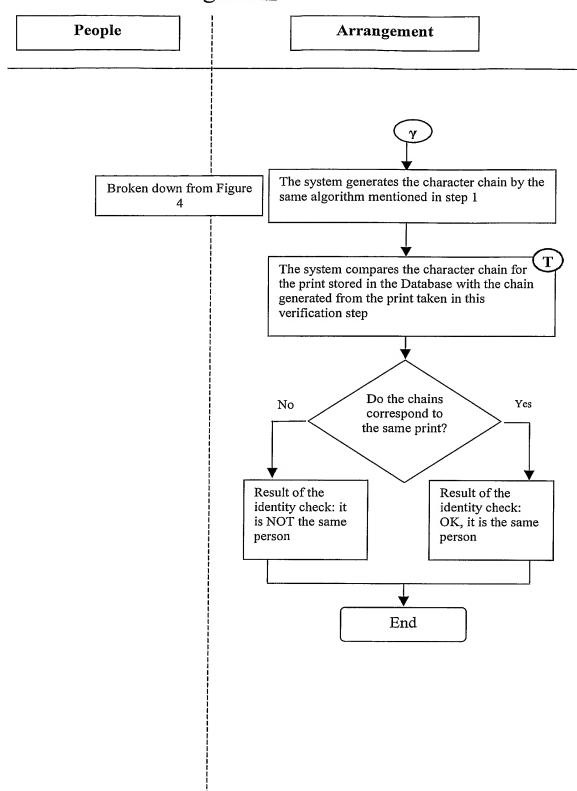

Figure 3A
Step 3) Identifying a Person by a fingerprint

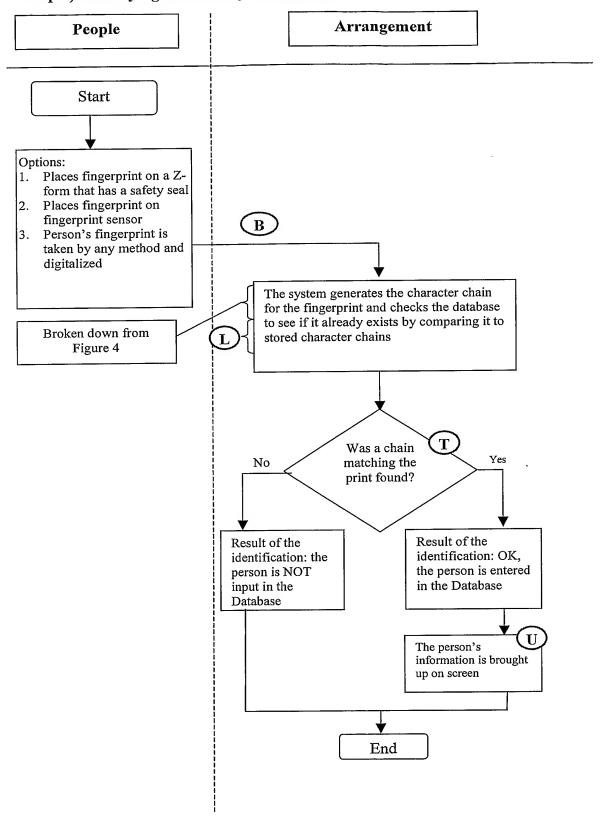

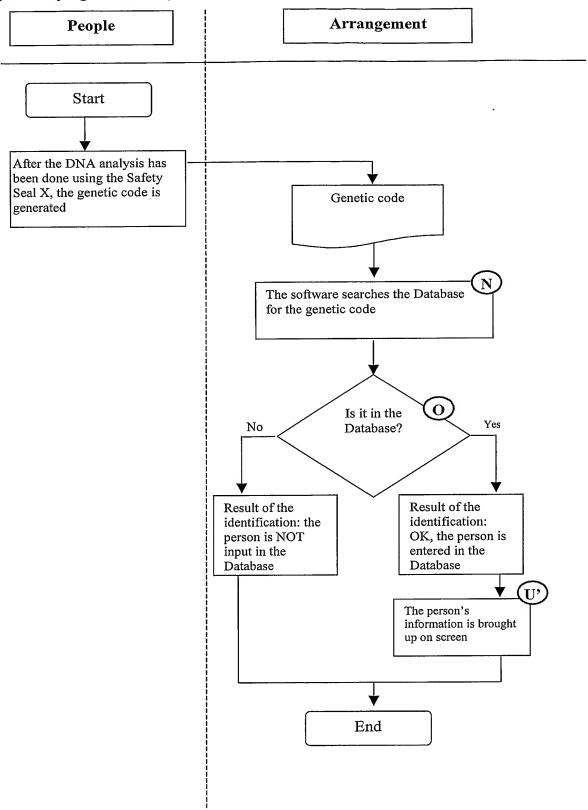

Figure 3B

Step 3) Identifying a Person by DNA

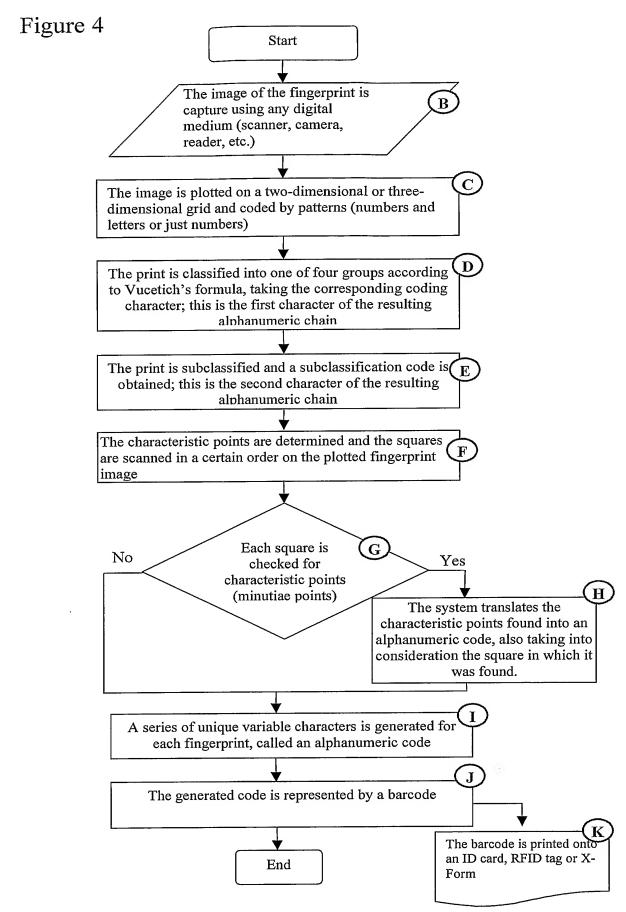

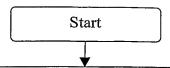

Figure 5

A biologist or biochemist takes a DNA sample from the person you want to identify for the information to be entered into the device's database. The sample can be taken using a non-intrusive safety seal or any other intrusive method (blood sample, saliva, fluids, etc.)

An analysis is done with specific reactives according to traditional techniques currently applied

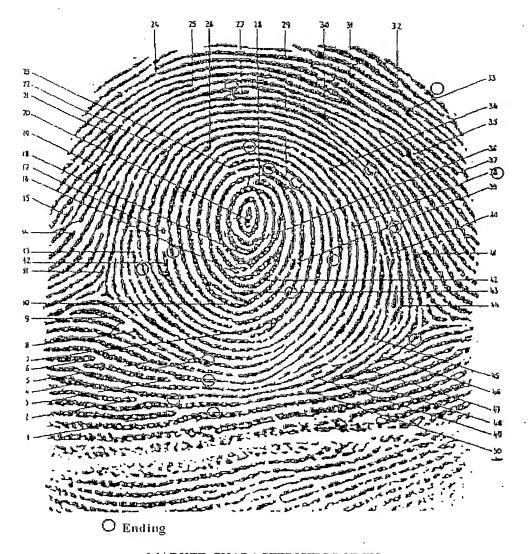

An alphabetic chain will be obtained from the result of the analysis; it is composed of four letters (A, C, G, and T) which will characterize the person you need to identify. For example: ATCGARCGCGATCG

This alphabetic chain is entered into the device's database and is represented by a unique and unrepeatable barcode. This barcode will be linked to the rest of the person's information

End

Image 3

Quality

Image 4

Each 8 x 8 block of pixels is assigned a value—0, 1, 2, 3, or 4—representing the quality level of the block. In turn, each value represents a quality percentage and is shown graphically with a color, varying between black and white:

0 = 0 % = black

1 = 25 % = dark gray

2 = 50 % = medium gray

3 = 75% = light gray

4 = 100 % = white

To obtain the general quality percentage or level of the print, the following formula is applied:

 \sum values of all blocks / Number of blocks
